VITAL STATISTICS
of
NEW YORK STATE
1991

New York State Department of Health

PREFACE

The 1991 edition of *Vital Statistics of New York State* summarizes data collected from vital records for residents of New York State in calendar year 1991. Information related to live births, deaths, fetal deaths, induced abortions, marriages and dissolutions of marriage is presented in summary form for the state and many geographic subdivisions. Additionally, population estimates are provided for reference and for use in calculating rates.

This report has been designed to assist public health agencies, other human resource agencies, researchers, health care providers and the public in assessing the health status of the New York State population. It contains useful summaries which are essential to the development, implementation and evaluation of effective health policy.

Additional copies of this report or more detailed information concerning vital statistics data can be obtained by contacting the Bureau of Biometrics of the New York State Department of Health. Comments regarding the format or content of this report are also welcomed.

POPULATION

LAKE GEORGE

POPULATION SUMMARY

NEW YORK STATE 1991

- The total resident population of New York State peaked at 18.2 million in 1970 and has fluctuated around 18 million thereafter.

- The population of New York State was estimated at 18,108,100 on July 1, 1991. This was an increase of 117,600 over the April 1, 1990 Census count of 17,990,455.

- New York City is 104 times more densely populated than New York State exclusive of New York City, comprising over 40.7 percent of the State's population. An additional 23.0 percent of the population reside in the six counties closest to New York City. New York County (Manhattan) has the highest population density of 52,576 persons per square mile while Hamilton County (Adirondack Mountain Area) has the lowest density of only 3 persons per square mile.

- The expectation of life at birth (E) for New York State residents reached an all time high of 75.2 years in 1991. The expectation of life at birth for females is 78.7, 7.3 years longer than that of males.

Note:

- Updated population estimates for counties (1981-1989) have been prepared by the U.S. Bureau of the Census (unpublished data) based upon the 1980 and the 1990 Modified Counts. The Department recommends the use of Modified Age, Race and Sex (MARS) data for 1990 in place of the same data in the 1990 Census Summary Tape Files.

Notes:

Age -- age interval of life stated in years
q -- probability of dying during the age interval
l -- number of survivors at the beginning of the age interval
d -- number of persons dying during the age interval
L -- person years lived during the age interval
T -- person years beyond the exact age at the beginning of the age interval
E -- expectation of life at the age at the beginning of the age interval

For more details about how to read the life table columns and interpret them, see the Technical Notes.

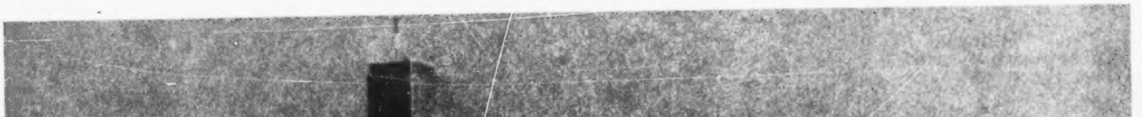
LIVE BIRTHS



MANHATTAN

BIRTH SUMMARY

NEW YORK STATE 1991

- There were 292,523 resident live births in New York State during 1991, a decrease of 1.7% from 1990. This was the first decrease in the number of births since 1978. Resident live births decreased in New York City and New York State exclusive of New York City by 1.0% and 2.2% respectively.
- The birth rates for New York State, New York City and New York State exclusive of New York City all decreased in 1991 to 16.2, 18.2, and 14.8 live births per 1,000 population.
- The general fertility rate decreased to 68.1 live births per 1,000 females aged 15 to 44 in New York State in 1991.
- The New York State live birth rates among teenagers, females aged 15-19, increased in 1991 to 44.2 live births per 1,000 females aged 15 to 19 years.
- The percentage of resident out-of-wedlock live births in New York State in 1991 increased to 34.0%, continuing the steady increase noted during the past decade.
- An increase occurred in the percentage of low birthweight live births (<2500 grams) in New York State in 1991. It rose to 7.9% from 7.6% in 1990.
- In 1991, 69.3 % of all women delivering live births received early prenatal care while only 8.5% received late or no prenatal care in New York State.
- In 1991 there were 67,135 cesarean deliveries in New York State. Cesarean deliveries rose through the 1980's from 44,348 in 1980 to a high of 69,022 in 1990.
- Over 30% of the live births in New York State in 1991 were covered by Medicaid.

Notes:

- The definition of race for live births in New York State in 1991 was changed to mother's race only. Prior to 1991, race was defined as a combination of the race of the mother and father.
- The number of New York State out-of-wedlock live births is imputed. New York State Public Health Law prohibits the specific statement on the birth certificate as to whether or not the mother of the child was married.

LIVE BIRTH RATES
PER 1,000 POPULATION
10.2-12.3
12.4-14.3
14.4-16.3
16.4-22.3

Highlights

- New York State has an overall live birth rate of 16.2 live births per 1,000 population in 1991, a decrease from 16.5 in 1990.
- The county with the highest live birth rate is Bronx County, with 22.3 live births per 1,000 population. Other counties with high live birth rates are Jefferson, Kings, Monroe, Orange, Queens and Richmond Counties.
- Hamilton County has the lowest live birth rate in 1991, with 10.2 live births per 1,000 population. Low live birth rates are also present in Delaware, Essex, Franklin, Otsego and Schoharie Counties.

[1] Live Birth Rates based on live births per 1,000 population

[2] Fertility Rates based on live births per 1,000 female population 15-44

[3] Fertility Rates for Age 45+ based on live births to women aged 45+ per 1,000 female population 45-49

All other rates are age-specific fertility rates

SPONTANEOUS FETAL DEATHS

WHITEFACE MOUNTAIN

SPONTANEOUS FETAL DEATHS SUMMARY

NEW YORK STATE 1991

- The spontaneous fetal death rate has remained fairly constant over the years 1978 to 1991. The rate has decreased slightly from 52.2 spontaneous fetal deaths per 1,000 live births plus spontaneous fetal deaths in 1990 to 49.7 in 1991.
- The spontaneous fetal death rate for New York City is 38.2 compared to 59.3 for New York State exclusive of New York City.
- Whites have a higher spontaneous fetal death rate (47.6) compared to Blacks (40.8) or other race (28.7). The rate for Hispanics is 24.2.

Notes:

- In the early 1970's, the spontaneous fetal death rate fluctuated dramatically due to the legalization of induced abortions in New York State.
- Unless otherwise stated, the data includes spontaneous fetal deaths of all gestations.

Spontaneous Fetal Death Rate = Number of Spontaneous Fetal Deaths per 1,000 Spontaneous Fetal Deaths + Live Births

[1] Total Spontaneous Fetal Deaths = White + Black + Other + Not Stated

[2] Hispanic Spontaneous Fetal Deaths is a separate count equal to Hispanic White + Hispanic Black + Hispanic Other + Hispanic Not Stated

INDUCED ABORTIONS

TAUGHANNOCK FALLS

INDUCED ABORTION SUMMARY

NEW YORK STATE 1991

- While the number of resident induced abortions in New York State decreased from 150,907 in 1990 to 149,418 in 1991, the abortion ratio rose from 507.3 in 1990 to 510.8 in 1991.

- Abortion ratios range from a high of 809.7 in Bronx County to a low of 47.0 in Jefferson County in 1991. New York City has an abortion ratio of 711.6 compared to New York State exclusive of New York City which has a ratio of 341.5.

- Abortion ratios vary by age and race. Higher abortion ratios exist for the lower age groups (10-14, 15-17) and the highest age group (45+). Blacks have an abortion ratio nearly three times higher than Whites (1006.0 for Blacks, 345.2 for Whites).

Notes:

- Induced abortions became legalized in New York State effective July 1, 1970.

- All information on induced abortions in this report is for New York State residents.

- The abortion ratio is the ratio of the number of induced abortions per 1,000 live births.

When there is more than one operative procedure, each operative procedure is counted separately. Thus the total of all operative procedures will be greater than the total of Induced Abortions

PREGNANCIES

STATUE OF LIBERTY

PREGNANCY SUMMARY

NEW YORK STATE 1991

- The pregnancy rate (number of pregnancies per 1,000 females aged 15-44) in New York State was fairly constant from 1972 to 1988, followed by an increase in 1989. A slight drop in the pregnancy rate occurred in 1991 compared to 1990 (106.5 versus 108.0).
- New York State had a total of 457,253 pregnancies in 1991, consisting of 292,523 live births, 149,418 induced abortions and 15,312 spontaneous fetal deaths.
- The county with the highest pregnancy rate was Bronx County with a rate of 164.9. Livingston County had the lowest pregnancy rate with 60.2 pregnancies per 1,000 female population aged 15-44.
- The teenage pregnancy rate continues to exhibit an overall upward trend from 1970 through 1991. The teenage pregnancy rate for 1991 however, is lower than the rate in 1990 (89.5 in 1991 versus 91.8 in 1990).

Notes:

- A pregnancy is defined as the sum of the live births plus spontaneous fetal deaths (all gestations) plus induced abortions, unless otherwise noted.
- Teenage pregnancy is defined as all live births plus spontaneous fetal deaths (all gestations) plus induced abortions for women aged 15-19.

MORTALITY

UPPER BUFFALO RIVER

DEATH SUMMARY

NEW YORK STATE 1991

- The number of resident deaths in New York State in 1991 decreased to 166,296, 0.3% less than in 1990. The death rate also declined by 1.1% to 9.2 deaths per 1,000 population. The death rate for 1991 was the lowest in 12 years.
- New York City deaths decreased by 1.6% to 71,341, and the death rate declined from 1990 by 2.0% to 9.7. In New York State exclusive of New York City, the number of deaths increased by 0.7% to 94,955 and the death rate remained the same as the 1990 rate of 8.8 deaths per 1,000 population.
- Infant mortality rates in New York State continued to decline in 1991 to 9.3 infant deaths per 1,000 live births, a decrease of 2.1%. Both New York City and New York State exclusive of New York City decreased to 11.3 and 7.6 respectively. This represents the lowest infant death rate ever recorded.
- The median age at death in New York State was 74 years in 1991. Both the median age of male and female decedents remained at the 1990 levels of 70 and 78 years respectively.
- The median age of decedents varied by race and ethnicity. In 1991, the median age at death for New York State residents was 54 years for Hispanics, 61 years for Blacks and 76 years for Whites.
- AIDS is the leading cause of death for the age group 25-44.
- The New York State death rate for diseases of the heart was the lowest since 1936.
- Malignant neoplasm death rates have remained constant for the last decade.

Note:

- Perinatal mortality is defined as the number of neonatal deaths plus spontaneous fetal deaths of gestations 20+ weeks.

DEATH RATES
PER 1,000 POPULATION
5.8-7.7
7.8-9.2
9.3-10.7
10.8-12.6

Highlights

- New York State has an overall death rate of 9.2 deaths per 1,000 population in 1991.
- Montgomery County has the highest death rate in 1991, with 12.6 deaths per 1,000 population. Other counties with high death rates are Chautauqua, Columbia, Delaware, Greene, Hamilton and Sullivan Counties.
- The county with the lowest death rate is Tompkins County with 5.8 deaths per 1,000 population. Clinton, Dutchess, Madison, Orange, Putnam, Rockland, Saratoga and Suffolk Counties also have low death rates.

INFANT MORTALITY RATES
PER 1,000 LIVE BIRTHS
0.0-4.1
4.2-7.5
7.6-11.6
11.7-17.1

Highlights

- In 1991, New York State has an overall infant mortality rate of 9.3 infant deaths per 1,000 live births.
- High infant mortality rates occurred in Bronx, Cortland, Delaware, Fulton, Kings, Schoharie and Tioga Counties. Delaware County had the highest infant mortality rate in 1991, with 17.1 infant deaths per 1,000 live births.
- Hamilton and Yates Counties did not have any infant deaths in 1991 and thus had infant mortality rates of 0.0. Other counties with low infant mortality rates in 1991 are Herkimer, Otsego, Steuben, Washington, Wayne and Wyoming Counties.

---

[1] Infant Death Rate -- deaths under 1 year of age per 1,000 live births

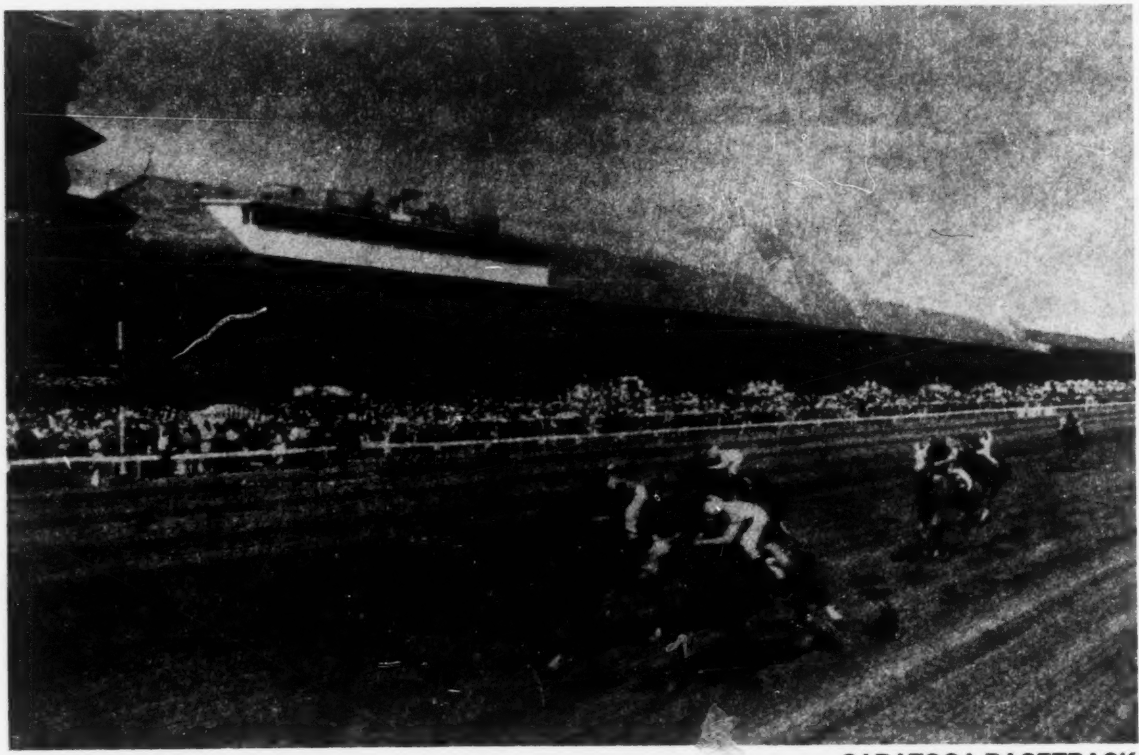
[2] Neonatal Death Rate -- deaths under 28 days per 1,000 live births

[3] Postneonatal Death Rate -- deaths at age 28 days and older, but less than 1 year per 1,000 live births

[4] Perinatal Mortality -- the number of neonatal deaths + spontaneous fetal deaths of gestation 20+ weeks

[5] Perinatal Mortality Rate -- the number of neonatal deaths + spontaneous fetal deaths of gestation 20+ weeks per 1,000 spontaneous fetal deaths of gestation 20+ weeks + live births

MARRIAGES & DISSOLUTIONS OF MARRIAGE



SARATOGA RACETRACK

MARRIAGES AND DISSOLUTIONS OF MARRIAGE SUMMARY

NEW YORK STATE 1991

- The number of marriages occurring in New York State in 1991 decreased by 6.4% from 1990 to 152,518, and the crude marriage rate also declined from 1990 to 8.4 marriages per 1,000 population.
- The median age of brides in New York State in 1991 was 27 years and 29 years for grooms.
- The most popular month for 1991 New York State marriages was June, and the least popular month was January.
- The number of dissolutions of marriage occurring in New York State in 1991 decreased by 3.0% from 1990 to 56,521, and the rate fell by 3.1% to 3.1 dissolutions per 1,000 population.
- Divorce accounted for 98.7% of all dissolutions of marriage in New York State in 1991.
- The leading legal grounds for divorce were abandonment (53.3%) and cruelty (36.2%).

Note:

- In 1991 all marriages were tabulated by county of occurrence. Prior to 1991, New York City marriages were tabulated where the license was issued and New York State exclusive of New York City marriages were tabulated by county of occurrence.

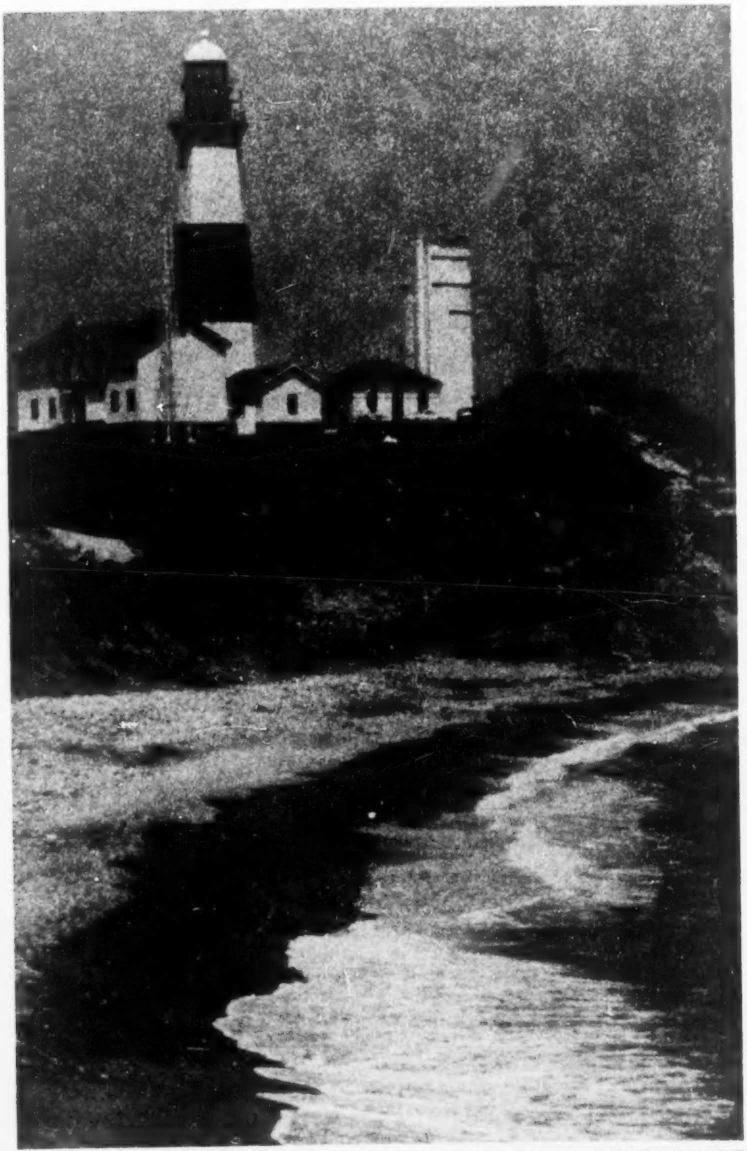
COUNTY PROFILES



MONTAUK LIGHTHOUSE

Table 53: County Profiles

Notes and Definitions

Trends

Population	1991 populations are estimated by the Bureau of Biometrics, the 1990 population is the modified 1990 census counts and 1987-1989 populations use the revised intercensal estimates provided by the U.S. Bureau of the Census
Live Births	Live Birth Rate is the number of live births per 1,000 population
Deaths	Death Rate is the number of deaths per 1,000 population
Infant Deaths	Infant Death Rate is the number of deaths under 1 year of age per 1,000 live births
Neonatal Deaths	Neonatal Death Rate is the number of deaths less than 28 days old per 1,000 live births
Spontaneous Fetal Deaths	Spontaneous Fetal Death Rate is the number of spontaneous fetal deaths (all gestations) per 1,000 spontaneous fetal deaths (all gestations) plus live births
Spon Fetal Deaths (20+ Weeks)	Spontaneous Fetal Death Rate is the number of spontaneous fetal deaths (only gestation 20 weeks or more) per 1,000 spontaneous fetal deaths (only gestation 20 weeks or more) plus live births
Induced Abortions (Ratio)	Abortion Ratio is the number of induced abortions per 1,000 live births
Marriages	Marriage Rate is the number of marriages per 1,000 population by county of occurrence
Dissolutions of Marriage	Dissolutions of Marriage Rate is the number of dissolutions of marriage per 1,000 population by county of occurrence

Natality

Live Births (Fertility Rate)	The rate calculated is the Fertility Rate, which is the number of live births per 1,000 female population aged 15-44
Teenage Live Births (aged 15-19)	Teenage Birth Rate is the number of live births to women aged 15-19 per 1,000 female population aged 15-19
Total Pregnancies	Total Pregnancies includes spontaneous fetal deaths (all gestations), induced abortions and live births Total Pregnancy Rate is the number of pregnancies per 1,000 female population aged 15-44
Teenage Pregnancies (aged 15-19)	Teenage Pregnancies includes spontaneous fetal deaths (all gestations), induced abortions and live births to women aged 15-19 Teenage Pregnancy Rate is the number of teenage pregnancies per 1,000 female population aged 15-19
Race	Race is categorized as White, Black and Other. Total includes not stated information. Hispanic is a separate count equal to Hispanic Whites, Hispanic Blacks, Hispanic Others and Hispanic Not Stated
Percent	Percentages do not include information Not Stated
Medicaid	Medicaid includes all live births that have financial coverage indicated as Medicaid
Out of Wedlock	See the Technical Notes on how marital status is imputed

Infant and Fetal Related Mortality

Infant Deaths	Infant Death Rate is the number of deaths under 1 year of age per 1,000 live births
Neonatal Deaths	Neonatal Death Rate is the number of deaths less than 28 days old per 1,000 live births
Perinatal Deaths	Perinatal Death Rate is the number of neonatal deaths and spontaneous fetal deaths of gestation 20 weeks or more, per 1,000 spontaneous fetal deaths 20 weeks or more plus live births
Spontaneous Fetal Deaths	Spontaneous Fetal Death Rate is the number of spontaneous fetal deaths (all gestations) per 1,000 spontaneous fetal deaths (all gestations) plus live births
Spon Fetal Deaths (20+ Weeks)	Spontaneous Fetal Death Rate is the number of spontaneous fetal deaths (only gestation 20 weeks or more) per 1,000 spontaneous fetal deaths (only gestation 20 weeks or more) plus live births
Induced Abortions (Ratio)	Abortion Ratio is the number of induced abortions per 1,000 live births

Mortality

Total	Total includes information Not Stated

Leading Causes of Death

Death Rate	Death Rate is the number of deaths per 100,000 population
COPD	Chronic Obstructive Pulmonary Disease

TECHNICAL NOTES

Registration

New York State consists of two registration areas, New York City and New York State exclusive of New York City. New York City includes the five counties of Bronx, Kings (Brooklyn), Queens, New York (Manhattan) and Richmond (Staten Island); the remaining 57 counties comprise New York State exclusive of New York City. The Bureau of Production Systems Management, New York State Department of Health processes data from live birth, death, fetal death and marriage certificates recorded in New York State exclusive of New York City. Through a cooperative agreement, the Department of Health receives data on live births, deaths, fetal deaths and marriages recorded in New York City and on live births and deaths recorded outside of New York State to residents of New York State. The Bureau of Production Systems Management processes data from dissolution of marriage certificates recorded in New York State.

Residence

Except for marriages and dissolution of marriages which are classified by county of occurrence, all the vital statistics presented in this report are based on the vital records of events to New York State residents. The events are allocated to the place of usual residence as reported on the certificates with one exception. Vital events occurring to inmates of state and federal institutions within the first year are allocated to their residence at the time of admission. After one year, the institution then becomes the place of residence. Vital events occurring to resident staff are allocated to the institution district.

Events occurring to residents of communities neighboring major metropolitan areas are sometimes misallocated. In areas where postal boundaries and civil divisions do not coincide, the mailing address is sometimes misreported as the place of residence. Analysis involving small geographic areas should be conducted with awareness of this potential problem.

Live Births

A live birth is defined as the complete expulsion or extraction from its mother of a product of conception, irrespective of duration of pregnancy, which after such separation, breathes or shows any other evidence of life such as beating of the heart, pulsation of the umbilical cord or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.

The selection of race for live births is determined by the mother's race only. Prior to 1991 the selection of the child's race was determined by the race of both the mother and the father.

The selection of ethnicity for live births is determined by the mother's ethnicity only. Prior to 1991 the selection of the child's ethnicity was determined by the ethnicity of both the mother and father.

Ethnicity is defined in the report as Hispanic events which are a separate count equal to the total of Hispanic Whites plus Hispanic Blacks plus Hispanic other race plus Hispanic with race not stated.

Early prenatal care is defined as prenatal care during the first trimester of the pregnancy. Late or no prenatal care is defined as prenatal care during the third trimester of the pregnancy or no prenatal care at all.

The method of delivery used for live births includes vaginal, cesarean and other method. *Other* method includes vaginal breech, mid and low forceps, vacuum, other and any procedure associated with an intended induced abortion.

Attendant at birth is defined as physician, midwife or other. *Physicians* include medical doctors and doctors of osteopath. *Midwife* includes certified nurse midwives and midwives.

The number of out-of-wedlock live births is imputed. New York State Public Health Law prohibits the specific statement on the birth certificate as to whether the child was born in wedlock or out-of-wedlock. Prior to 1977, marital status was inferred by examining the statistical information on the certificate of live birth. In 1977, the procedure was modified to also identify out-of-wedlock live births for which paternity affidavits were filed. These births were previously inferred to have occurred in wedlock. This modification resulted in a noticeable increase in the estimated number of out-of-wedlock live births starting in 1977.

Deaths

The cause of death reported in this publication is the underlying cause classified according to the ninth revision of the *International Classification of Diseases* (ICD, 9th revision) adopted by New York State in 1979. Historically, several revisions of the ICD have been used; therefore, it is necessary to employ a comparability ratio when comparing cause of death statistics from one revision to another. Comparability ratios have been published by the National Center for Health Statistics (NCHS).

Infant and neonatal mortality rates published in this report are based on all live births regardless of birthweight or gestation. No attempt was made to account for the viability of the infant at birth. These rates for a specific year are based on live births that occurred during that year. While these live births are not the true population at risk, they are an accurate and timely estimate of that population.

Other institution is defined as state institution, Veterans Administration facility, hospice, federal institution, health related facility or home for the aged.

Spontaneous Fetal Deaths/Induced Abortions

Fetal deaths include both induced abortions and spontaneous fetal deaths and are presented separately in the report.

Fetal death is defined by New York State Public Health Law to be the death prior to the complete expulsion or extraction from its mother of a product of conception; the death is indicated by the fact that after such separation, the fetus does not breathe or show any other evidence of life such as beating of the heart, pulsation of the umbilical cord or definite movement of voluntary muscles.

Operative procedure used for induced abortions is defined as dilation and curettage (D&C), suction and curettage, dilation & evacuation (D&E),saline injection, and other which includes prostaglandin injection, hysterectomy, hysterotomy and other procedures.

New York State Public Health Law requires the registration of all fetal deaths regardless of the gestation of the fetus. Unlike birth and death registration, the registration of fetal mortality is not uniform across the United States. In order to provide data comparable to other states, this report presents data for both spontaneous fetal deaths of gestation 20 weeks or more and for spontaneous fetal deaths of all gestations.

Population

Population Estimates - The July 1, 1991 estimates were calculated by adding the estimated natural increase during 1990-1991 and the estimated net-migration during 1990-1991 to the 1990 Census population. The estimated net-migration for each minor civil division in the state was based on the average annual net-migration experience during the 1986-1990 period.

The population for New York State exclusive of New York City is the sum of the estimates for the 57 counties in the state outside New York City. The population for New York City is the sum of the population estimates for the five counties of the city.

Population Estimates by Age and Sex - The population estimates by age and sex for July 1, 1991, appearing in Table 1 were estimated in two steps. The estimated number of children under five was developed from birth and death data and corrected for estimated net-migration. This migration was based on New York State birth and death data and the 1990 Modified Count data by age and sex. The population over five was estimated using the 1990 population by age and sex, resident death data by age and sex, and estimated migration data by age and sex based on the censuses of 1980 and 1990. The populations in each age group over five were then uniformly adjusted so that the sum of all the age groups in Table 1 equalled the population estimates for July 1, 1991, for New York City and New York State exclusive of New York City as given in Table 2. The New York State population estimates by age and sex are the sum of the New York City and New York State exclusive of New York City estimates.

The standard five year age distribution for July 1, 1991, as calculated above was subdivided into single year age groups by using the Sprague multipliers. The single year distributions were then combined to form population estimates for 15-17 and 18-19 age groups for New York City, New York State exclusive of New York City, and New York State.

Life Tables: A set of three life tables is presented which includes the total, male and female populations of New York State. Each life table consists of seven columns. They are:

Age -- the interval between two exact ages, x to x+n. For example, the age group *15-19* includes the five year interval of all persons aged 15 to 1 day less than 20 years old.

q -- is the probability of dying during x to x+n. This is the proportion of deaths that occur during the interval x to x+n among a cohort who were alive at the beginning of the interval.

l -- is the number of survivors at exact age x. Starting with a cohort of 100,000 live births, l is the number of persons who survived to the beginning of each age interval. The number of survivors at the beginning of an age interval multiplied by the probability of surviving the interval gives the number of survivors at the beginning of the next age interval.

d -- is the number of persons dying during x to x+n. This column represents the number of persons from the cohort of 100,000 who die during x to x+n.

L -- is the number of person-years lived during x to x+n. The number of person-years includes those who live the full n years of the interval and those who live less than n years.

T -- is the number of person-years lived beyond exact age x.

E -- is the expectation of life at exact age x. This is the average years of life remaining to be lived by persons of exact age x.

Vital Statistics Rates and Ratios

The definition of the rates used for this report are given below. In a definition, the numerator reflects the number of vital events counted in a specified period of time, usually a calendar year. The denominator refers to the population count at a specified point in time, usually mid-calendar year.

1. *Live Birth Rate*: Annual number of live births per 1,000 population.

2. *General Fertility Rate*: Annual number of live births per 1,000 female population aged 15-44.

3. *Teenage Live Birth Rate*: Annual number of live births to women aged 15-19 per 1,000 female population aged 15-19.

4. *Spontaneous Fetal Mortality Rate*: Annual number of spontaneous fetal deaths (all gestations) per 1,000 spontaneous fetal deaths (all gestations) plus live births occurring during the year.

5. *Abortion Ratio*: Annual number of induced abortions per 1,000 live births occurring during the year.

6. *Total Pregnancy Rate*: Annual number of pregnancies per 1,000 female population aged 15-44.

7. *Teenage Pregnancy Rate*: Annual number of teenage pregnancies per 1,000 female population aged 15-19.

8. *(Crude) Death Rate*: Annual number of deaths per 1,000 population.

9. *Infant Mortality Rate*: Annual number of deaths under one year of age per 1,000 live births occurring during the year.

10 *Neonatal Mortality Rate*: Annual number of deaths under 28 days of age per 1,000 live births occurring during the year.

11. *Postneonatal Mortality Rate*: Annual number of deaths at age 28 days and older but less than one year per 1,000 live births occurring during the year.

12. *Perinatal Mortality Rate*: Annual number of neonatal deaths plus spontaneous fetal deaths of gestation 20 weeks or more per 1,000 spontaneous fetal deaths of gestation 20 weeks or more plus live births occurring during the year.

13. *Age-Specific Rate*: Annual number of deaths in a specified age group per 1,000 population in the same age group. Age is decendent's age at last birthday.

14. *Cause-Specific Death Rate*: Annual number of deaths from a specified cause or group of causes per 100,000 population. Exception: the death rate from complications of pregnancy, childbirth and the puerperium is defined as number of deaths from complications of pregnancy, childbirth and the puerperium occurring during the year per 100,000 live births occurring during that year. This death rate is called the maternal mortality rate. This cause of death category also includes any maternal death which may have resulted from an induced abortion.

15. *Age-Sex-Adjusted Death Rate (Direct Method)*: Death rate of a group calculated as a weighted average of the age-sex-specific death rate of the same group. The system of weights is the age-sex-distribution of a population called the standard population. In this report, the standard population is the census count of the New York State modified census population on April 1, 1990.

16. *Marriage Rate*: Annual number of marriages per 1,000 population.

17. *Dissolution of Marriage Rate*: Annual number of dissolutions of marriage per 1,000 population.

Small Area Data

In tabulating vital events for cities and villages with 15,000 or more population, the problem of small frequencies occurs. Statistics based on a small number of vital events are subject to a large degree of variability and inferences should be made with care.

Maps

The maps presented in this report show the rates associated with selected vital events. Population characteristics determine in part the size of these measurements. For each map the counties are ranked from the lowest to the highest rate. Counties are then classified into four categories: the lowest 10 percent of all counties, counties ranging from 10 to 50 percent, counties ranging from 50 to 90 percent and the highest 10 percent of all counties.

General mortality rates are influenced markedly by the age and sex distributions of the population. In general, men have higher death rates than women at all ages and people over the age of 55 die at a higher rate than the young.

In those counties different in rates but similar in population characteristics, identification of causative factors can be obtained only by rigorous epidemiological studies, not by simple correlations of vital statistics.

VITAL STATISTICS
of
NEW YORK STATE
1992

New York State Department of Health

PREFACE

The 1992 edition of *Vital Statistics of New York State* summarizes data collected from vital records for residents of New York State in calendar year 1992. Information related to live births, deaths, fetal deaths, induced abortions, marriages and dissolutions of marriage is presented in summary form for the state and many geographic subdivisions. Additionally, population estimates are provided for reference and for use in calculating rates.

This report has been designed to assist public health agencies, other human resource agencies, researchers, health care providers and the public in assessing the health status of the New York State population. It contains useful summaries which are essential to the development, implementation and evaluation of effective health policy.

Additional copies of this report or more detailed information concerning vital statistics data can be obtained by contacting the Bureau of Biometrics of the New York State Department of Health. Comments regarding the format or content of this report are also welcomed.

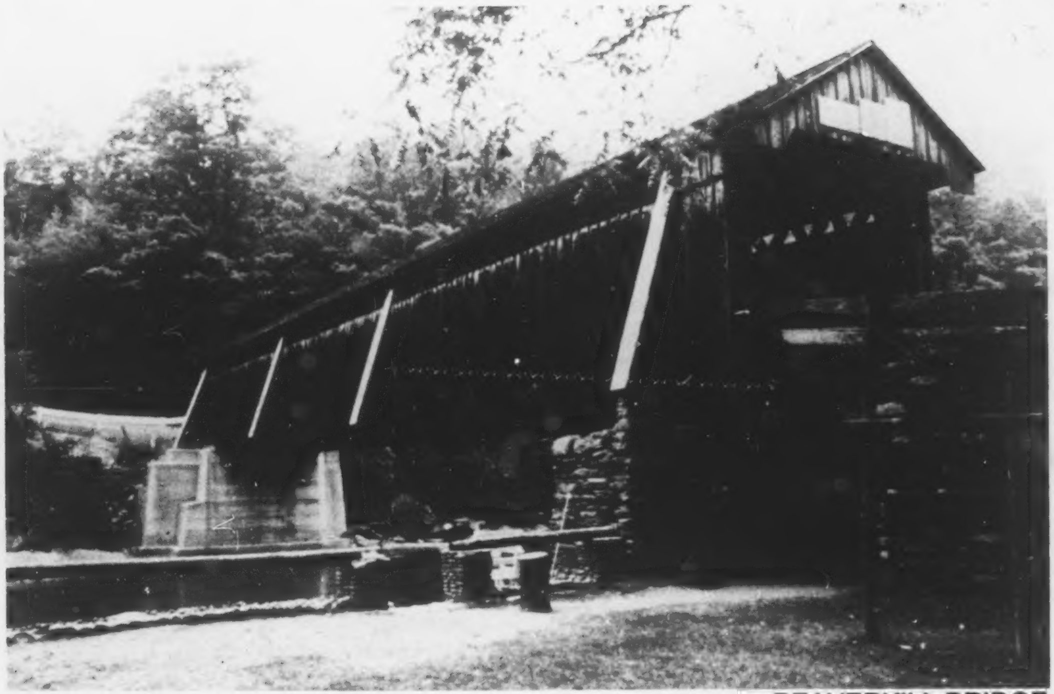
POPULATION



BEAVERKILL BRIDGE

POPULATION SUMMARY

NEW YORK STATE 1992

- The population of New York State was estimated at 18,199,300 on July 1, 1992. This was an increase of 208,845 over the April 1, 1990 Census count of 17,990,455.

- The total resident population of New York State is approaching the peak years of the early 1970's.

- New York City is 104 times more densely populated than New York State exclusive of New York City, comprising over 40.7 percent of the State's population. An additional 23.0 percent of the population reside in the six counties closest to New York City. New York County (Manhattan) has the highest population density of 52,703 persons per square mile while Hamilton County (Adirondack Mountain Area) has the lowest density of only 3 persons per square mile.

- The expectation of life at birth (E) for New York State residents reached an all time high of 75.5 years in 1992. The expectation of life at birth for females is 78.9, 7.1 years longer than that of males.

Note:

- Updated population estimates for counties (1981-1989) have been prepared by the U.S. Bureau of the Census (unpublished data) based upon the 1980 and the 1990 Modified Counts. The Department recommends the use of Modified Age, Race and Sex (MARS) data for 1990 in place of the same data in the 1990 Census Summary Tape Files.

Notes:

Age -- age interval of life stated in years
q -- probability of dying during the age interval
l -- number of survivors at the beginning of the age interval
d -- number of persons dying during the age interval
L -- person years lived during the age interval
T -- person years beyond the exact age at the beginning of the age interval
E -- expectation of life at the age at the beginning of the age interval

For more details about how to read the life table columns and interpret them, see the Technical Notes.

LIVE BIRTHS

SAG HARBOR MARINA

BIRTH SUMMARY

NEW YORK STATE 1992

- There were 287,531 resident live births in New York State during 1992, a decrease of 1.7% from 1991. This continues the decrease which started in 1991. Resident live births decreased in New York City and New York State exclusive of New York City by 1.6% and 1.8% respectively.
- The birth rates for New York State, New York City and New York State exclusive of New York City all decreased in 1992 to 15.8, 17.8, and 14.4 live births per 1,000 population.
- The general fertility rate decreased to 67.2 live births per 1,000 females aged 15 to 44 in New York State in 1992.
- The New York State live birth rates among teenagers, females aged 15-19, decreased in 1992 to 43.4 live births per 1,000 females aged 15 to 19 years.
- The percentage of resident out-of-wedlock live births in New York State in 1992 increased to 34.7%, continuing the steady increase noted during the past decade.
- A decrease occurred in the percentage of low birthweight live births (<2500 grams) in New York State in 1992. It declined to 7.6% from 7.9% in 1991.
- In 1992, 70.5 % of all women delivering live births received early prenatal care while only 7.9% received late or no prenatal care in New York State.
- In 1992, cesarean deliveries in New York State decreased for the second straight year. Cesarean deliveries rose through the 1980's from 44,348 in 1980 to a high of 69,022 in 1990.
- Nearly 38% of the live births in New York State in 1992 were covered by Medicaid.

Note:

- The number of New York State out-of-wedlock live births is imputed. New York State Public Health Law prohibits the specific statement on the birth certificate as to whether or not the mother of the child was married.

LIVE BIRTH RATES
PER 1,000 POPULATION
9.6-12.1
12.2-13.7
13.8-16.1
16.2-21.5

Highlights

- New York State has an overall live birth rate of 15.8 live births per 1,000 population in 1992, a decrease from 16.2 in 1991.
- The county with the highest live birth rate is Bronx County, with 21.5 live births per 1,000 population. Other counties with high live birth rates are Jefferson, Kings, Monroe, Orange, Queens and Richmond Counties.
- Hamilton County has the lowest live birth rate in 1992, with 9.6 live births per 1,000 population. Low live birth rates are also present in Columbia, Franklin, Otsego, Schoharie, Schuyler and Tompkins Counties.

[1] Live Birth Rates based on live births per 1,000 population

[2] Fertility Rates based on live births per 1,000 female population 15-44

[3] Fertility Rates for Age 45+ based on live births to women aged 45+ per 1,000 female population 45-49

All other rates are age-specific fertility rates

SPONTANEOUS FETAL DEATHS

CENTRAL PARK, NEW YORK CITY

SPONTANEOUS FETAL DEATHS SUMMARY

NEW YORK STATE 1992

- The spontaneous fetal death rate remained fairly constant over the years 1978 to 1990. In 1991, it rose dramatically to 79.7 and dropped slightly in 1992 to 75.7. The reason for this sharp increase (52.7%) was improved reporting in New York City. (See notes.)

- The spontaneous fetal death rate for New York City is 91.1 compared to 62.2 for New York State exclusive of New York City.

- Blacks have a higher spontaneous fetal death rate (96.5) compared to Whites (62.6) or other race (48.1). The rate for Hispanics is 47.9.

Notes:

- In 1992, the New York City Department of Health implemented a program to improve reporting of spontaneous fetal deaths. As a result, during 1992 a substantial number of spontaneous fetal deaths recorded in New York City in the years 1991 and 1992 were reported. The data presented here reflect this increase in reporting of 1991 and 1992 events. All tables in this report containing information on 1991 spontaneous fetal deaths have been updated from previously published figures.

- In the early 1970's, the spontaneous fetal death rate fluctuated dramatically due to the legalization of induced abortions in New York State.

- Unless otherwise stated, the data includes spontaneous fetal deaths of all gestations.

Spontaneous Fetal Death Rate = Number of Spontaneous Fetal Deaths per 1,000 Spontaneous Fetal Deaths + Live Births

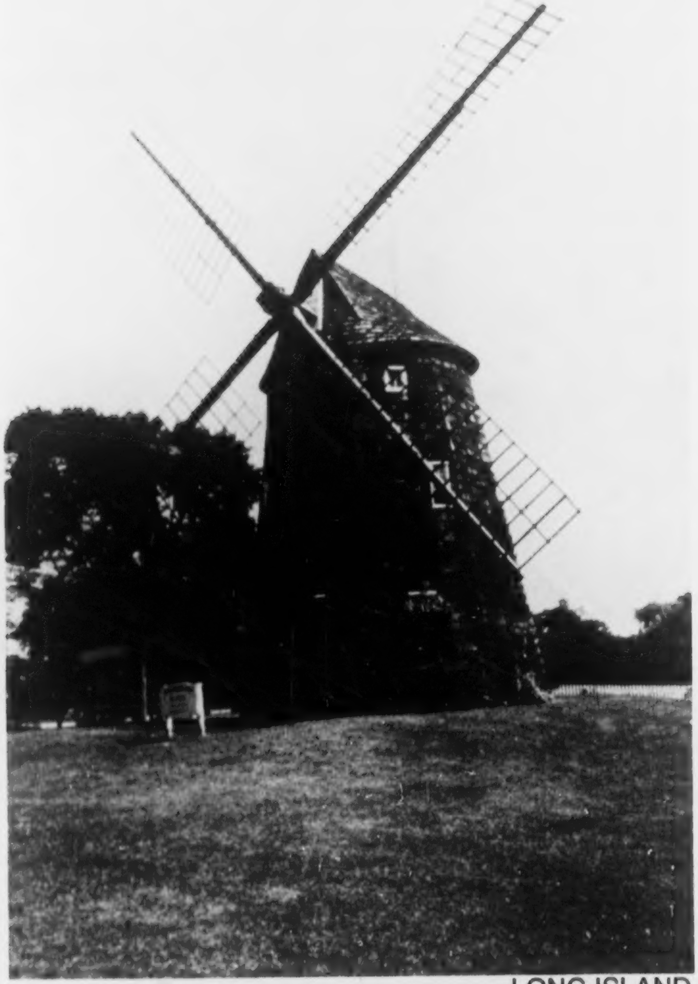
[1] Total Spontaneous Fetal Deaths = White + Black + Other + Not Stated

[2] Hispanic Spontaneous Fetal Deaths is a separate count equal to Hispanic White + Hispanic Black + Hispanic Other + Hispanic Not Stated

INDUCED ABORTIONS



LONG ISLAND

INDUCED ABORTION SUMMARY

NEW YORK STATE 1992

- The number of resident induced abortions in New York State increased to 152,785 in 1992, and the abortion ratio rose from 510.8 in 1991 to 531.4 in 1992.

- New York City showed a large increase from 1991 with 102,006 induced abortions while New York State exclusive of New York City actually decreased to 50,779 in 1992.

- Abortion ratios range from a high of 923.4 in Bronx County to a low of 58.0 in Lewis County in 1992. New York City has an abortion ratio of 775.0 compared to New York State exclusive of New York City which has a ratio of 325.7.

- Abortion ratios vary by age, race and ethnicity. Higher abortion ratios exist for the lower age groups (10-14, 15-17, 18-19) and the highest age group (45+). Blacks have an abortion ratio nearly three times higher than Whites (1081.8 for Blacks, 362.8 for Whites). The abortion ratio for Hispanics is 570.6.

- Approximately 37% of the induced abortions in New York State were covered by Medicaid.

Notes:

- Induced abortions became legalized in New York State effective July 1, 1970.

- All information on induced abortions in this report is for New York State residents.

- The abortion ratio is the number of induced abortions per 1,000 live births.

When there is more than one operative procedure, each operative procedure is counted separately. Thus the total of all operative procedures will be greater than the total of Induced Abortions.

[1] Total Induced Abortions = White + Black + Other + Not Stated

[2] Hispanic Induced Abortions is a separate count equal to Hispanic White + Hispanic Black + Hispanic Other + Hispanic Not Stated

When there is more than one operative procedure, each operative procedure is counted separately. Thus the total of all operative procedures will be greater than the total of Induced Abortions

[1] Total includes records with information Not Stated

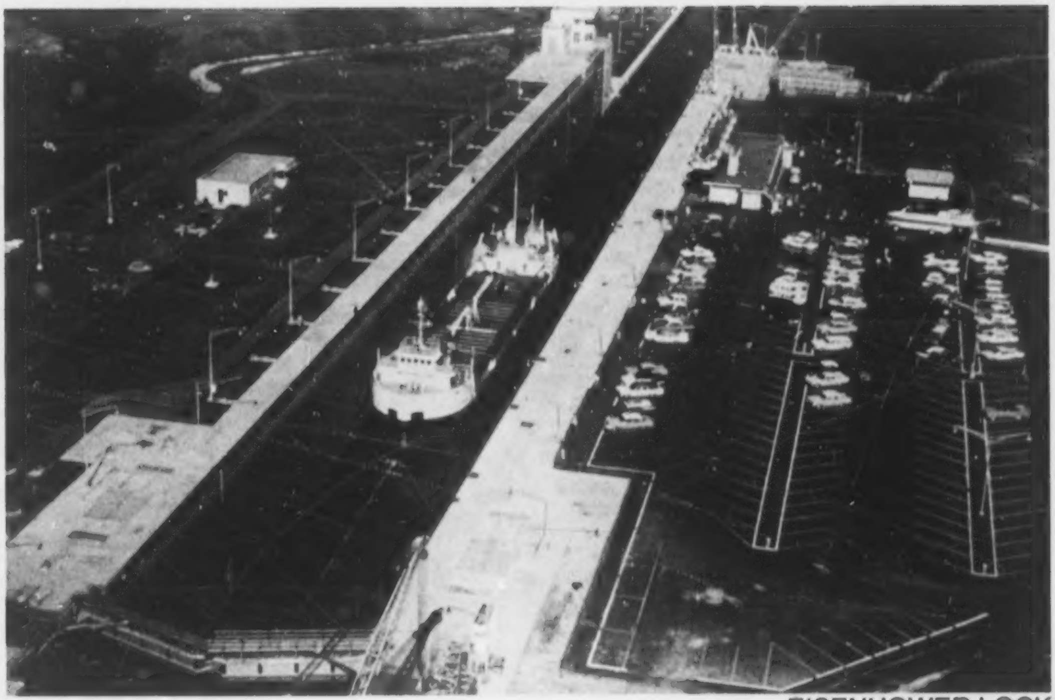
When there is more than one operative procedure, each operative procedure is counted separately. Thus the total of all operative procedures will be greater than the total of Induced Abortions

PREGNANCIES



EISENHOWER LOCK

PREGNANCY SUMMARY

NEW YORK STATE 1992

- The pregnancy rate (number of pregnancies per 1,000 females aged 15-44) in New York State was fairly constant from 1972 to 1988, followed by an increase in 1989 and 1990. Since 1990 it has remained fairly constant with the rate being 108.4 in 1992.

- New York State had a total of 463,850 pregnancies in 1992, consisting of 287,531 live births, 152,785 induced abortions and 23,534 spontaneous fetal deaths.

- The county with the highest pregnancy rate was Bronx County with a rate of 177.2. Livingston County had the lowest pregnancy rate with 57.3 pregnancies per 1,000 female population aged 15-44.

- The teenage pregnancy rate continues to exhibit an overall upward trend from 1970 through 1992. The teenage pregnancy rate for 1992 increased to 92.3 from 91.0 in 1991.

Notes:

- In 1992, the New York City Department of Health implemented a program to improve reporting of spontaneous fetal deaths. As a result, during 1992 a substantial number of spontaneous fetal deaths recorded in New York City in the years 1991 and 1992 were reported. The data presented here reflect this increase in reporting of 1991 and 1992 events. All tables in this report containing information on 1991 pregnancies have been updated from previously published figures.

- Pregnancy is defined as the sum of the live births plus spontaneous fetal deaths (all gestations) plus induced abortions, unless otherwise noted.

- Teenage pregnancy is defined as all live births plus spontaneous fetal deaths (all gestations) plus induced abortions for women aged 15-19.

DEATH SUMMARY

NEW YORK STATE 1992

- The number of resident deaths in New York State in 1992 decreased to 164,986, 0.8% less than in 1991. The death rate also declined by 1.1% to 9.1 deaths per 1,000 population. The death rate for 1992 was the lowest ever recorded in New York State.

- New York City deaths decreased by 1.9% to 70,000, and the death rate declined from 1991 by 3.1% to 9.4. In New York State exclusive of New York City, the number of deaths increased to 94,986 and the death rate remained the same as the 1991 rate of 8.8 deaths per 1,000 population.

- Infant mortality rates in New York State continued to decline in 1992 to 8.7 infant deaths per 1,000 live births, a decrease of 6.5%. This represents the lowest infant death rate ever recorded.

- The median age at death in New York State was 74 years in 1992. Both the median age of male and female decedents remained at the 1991 levels of 70 and 78 years respectively.

- The median age of decedents varied by race and ethnicity. In 1992, the median age at death for New York State residents was 53 years for Hispanics, 61 years for Blacks and 76 years for Whites.

- AIDS became the 4th leading cause of death in 1992 and is the leading cause of death for the age group 25-44.

- The New York State death rate for diseases of the heart continues its decline from the early 1980s.

- Malignant neoplasm death rates have remained constant for the last decade.

- Homicide is the leading cause of death for the age groups 10-19 and 20-24.

Note:

- Perinatal mortality is defined as the number of neonatal deaths plus spontaneous fetal deaths of gestations 20+ weeks.

DEATH RATES
PER 1,000 POPULATION
5.8-7.5
7.6-9.1
9.2-10.3
10.4-12.7

Highlights

- New York State has an overall death rate of 9.1 deaths per 1,000 population in 1992.
- Montgomery County has the highest death rate in 1992, with 12.7 deaths per 1,000 population. Other counties with high death rates are Columbia, Delaware, Erie, Fulton, Greene, Herkimer, Schenectady, Seneca and Sullivan Counties.
- The county with the lowest death rate is Tompkins County with 5.8 deaths per 1,000 population. Clinton, Jefferson, Orange, Putnam, Rockland and Saratoga also have low death rates.

INFANT MORTALITY RATES
PER 1,000 LIVE BIRTHS
0.0-4.3
4.4-7.9
8.0-10.8
10.9-12.6

Highlights

- In 1992, New York State has an overall infant mortality rate of 8.7 infant deaths per 1,000 live births.
- High infant mortality rates occurred in Bronx, Chemung, Kings, Orleans, Schenectady, Steuben and Wyoming Counties. Chemung County had the highest infant mortality rate in 1992, with 12.6 infant deaths per 1,000 live births.
- Hamilton County did not have any infant deaths in 1992 and thus had infant mortality rate of 0.0. Other counties with low infant mortality rates in 1992 are Cortland, Columbia, Putnam, Schuyler, Seneca and Tompkins Counties.

MARRIAGES AND DISSOLUTIONS OF MARRIAGE SUMMARY

NEW YORK STATE 1992

- The number of marriages occurring in New York State in 1992 increased by 0.3% from 1991 to 153,045, while the crude marriage rate remained the same as 1991 with 8.4 marriages per 1,000 population.
- The median age of brides in New York State in 1992 was 27 years and 29 years for grooms.
- The most popular month for 1992 New York State marriages was August, and the least popular month was January.
- The number of dissolutions of marriage occurring in New York State in 1992 increased by 3.3% from 1991 to 58,397, and the rate rose by 3.2% to 3.2 dissolutions per 1,000 population.
- Divorce accounted for 98.8% of all dissolutions of marriage in New York State in 1992.
- The leading legal grounds for divorce were abandonment (54.9%) and cruelty (35.0%).
- Approximately 25% of all divorces take place during the first 5 years after marriage.

Note:

- In 1991 and 1992 all marriages were tabulated by county of occurrence. Prior to 1991, New York City marriages were tabulated where the license was issued and New York State exclusive of New York City marriages were tabulated by county of occurrence.

COUNTY PROFILES

EMPIRE STATE PLAZA, ALBANY

Table 53: County Profiles

Notes and Definitions

Trends

Population	1992 and 1991 populations are estimated by the Bureau of Biometrics, the 1990 population is the modified 1990 census counts and 1988 and 1989 populations use the revised intercensal estimates provided by the U.S. Bureau of the Census
Live Births	Live Birth Rate is the number of live births per 1,000 population
Deaths	Death Rate is the number of deaths per 1,000 population
Infant Deaths	Infant Death Rate is the number of deaths under 1 year of age per 1,000 live births
Neonatal Deaths	Neonatal Death Rate is the number of deaths less than 28 days old per 1,000 live births
Spontaneous Fetal Deaths	Spontaneous Fetal Death Rate is the number of spontaneous fetal deaths (all gestations) per 1,000 spontaneous fetal deaths (all gestations) plus live births
Spon Fetal Deaths (20+ Weeks)	Spontaneous Fetal Death Rate is the number of spontaneous fetal deaths (only gestation 20 weeks or more) per 1,000 spontaneous fetal deaths (only gestation 20 weeks or more) plus live births
Induced Abortions (Ratio)	Abortion Ratio is the number of induced abortions per 1,000 live births
Marriages	Marriage Rate is the number of marriages per 1,000 population by county of occurrence
Dissolutions of Marriage	Dissolutions of Marriage Rate is the number of Dissolutions of Marriage per 1,000 population by county of occurrence

Natality

Live Births (Fertility Rate)	The rate calculated is the Fertility Rate, which is the number of live births per 1,000 female population aged 15-44
Teenage Live Births (aged 15-19)	Teenage Birth Rate is the number of live births to women aged 15-19 per 1,000 female population aged 15-19
Total Pregnancies	Total Pregnancies includes spontaneous fetal deaths (all gestations), induced abortions and live births Total Pregnancy Rate is the number of pregnancies per 1,000 female population aged 15-44
Teenage Pregnancies (aged 15-19)	Teenage Pregnancies includes spontaneous fetal deaths (all gestations), induced abortions and live births to women aged 15-19 Teenage Pregnancy Rate is the number of teenage pregnancies per 1,000 female population aged 15-19
Race	Race is categorized as White, Black and Other. Total includes not stated information. Hispanic is a separate count equal to Hispanic Whites, Hispanic Blacks, Hispanic Others and Hispanic Not Stated
Percent	Percentages do not include information Not Stated
Medicaid	Medicaid includes all live births that have financial coverage indicated as Medicaid
Out of Wedlock	See the Technical Notes on how marital status is imputed

Infant and Fetal Related Mortality

Infant Deaths	Infant Death Rate is the number of deaths under 1 year of age per 1,000 live births
Neonatal Deaths	Neonatal Death Rate is the number of deaths less than 28 days old per 1,000 live births
Perinatal Deaths	Perinatal Death Rate is the number of neonatal deaths and spontaneous fetal deaths of gestation 20 weeks or more, per 1,000 spontaneous fetal deaths 20 weeks or more plus live births
Spontaneous Fetal Deaths	Spontaneous Fetal Death Rate is the number of spontaneous fetal deaths (all gestations) per 1,000 spontaneous fetal deaths (all gestations) plus live births
Spon Fetal Deaths (20+ Weeks)	Spontaneous Fetal Death Rate is the number of spontaneous fetal deaths (only gestation 20 weeks or more) per 1,000 spontaneous fetal deaths (only gestation 20 weeks or more) plus live births
Induced Abortions (Ratio)	Abortion Ratio is the number of induced abortions per 1,000 live births

Mortality

Total	Total includes information Not Stated

Leading Causes of Death

Death Rate	Death Rate is the number of deaths per 100,000 population
COPD	Chronic Obstructive Pulmonary Disease

TECHNICAL NOTES

Registration

New York State consists of two registration areas, New York City and New York State exclusive of New York City. New York City includes the five counties of Bronx, Kings (Brooklyn), Queens, New York (Manhattan) and Richmond (Staten Island); the remaining 57 counties comprise New York State exclusive of New York City. The Bureau of Production Systems Management, New York State Department of Health processes data from live birth, death, fetal death and marriage certificates recorded in New York State exclusive of New York City. Through a cooperative agreement, the Department of Health receives data on live births, deaths, fetal deaths and marriages recorded in New York City and on live births and deaths recorded outside of New York State to residents of New York State. The Bureau of Production Systems Management processes data from dissolution of marriage certificates recorded in New York State.

Residence

Except for marriages and dissolution of marriages which are classified by county of occurrence, all the vital statistics presented in this report are based on the vital records of events to New York State residents. The events are allocated to the place of usual residence as reported on the certificates with one exception. Vital events occurring to inmates of state and federal institutions within the first year are allocated to their residence at the time of admission. After one year, the institution then becomes the place of residence. Vital events occurring to resident staff are allocated to the institution district.

Events occurring to residents of communities neighboring major metropolitan areas are sometimes misallocated. In areas where postal boundaries and civil divisions do not coincide, the mailing address is sometimes misreported as the place of residence. Analysis involving small geographic areas should be conducted with awareness of this potential problem.

Live Births

A live birth is defined as the complete expulsion or extraction from its mother of a product of conception, irrespective of duration of pregnancy, which after such separation, breathes or shows any other evidence of life such as beating of the heart, pulsation of the umbilical cord or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.

The selection of race for live births is determined by the mother's race only. Prior to 1991 the selection of the child's race was determined by the race of both the mother and the father.

The selection of ethnicity for live births is determined by the mother's ethnicity only. Prior to 1991 the selection of the child's ethnicity was determined by the ethnicity of both the mother and father.

Ethnicity is defined in the report as Hispanic events which are a separate count equal to the total of Hispanic Whites plus Hispanic Blacks plus Hispanic other race plus Hispanic with race not stated.

Early prenatal care is defined as prenatal care during the first trimester of the pregnancy. Late or no prenatal care is defined as prenatal care during the third trimester of the pregnancy or no prenatal care at all.

The method of delivery used for live births includes vaginal, cesarean and other method. *Other* method includes vaginal breech, mid and low forceps, vacuum, other and any procedure associated with an intended induced abortion.

Attendant at birth is defined as physician, midwife or other. *Physicians* include medical doctors and doctors of osteopath. *Midwife* includes certified nurse midwives and midwives.

The number of out-of-wedlock live births is imputed. New York State Public Health Law prohibits the specific statement on the birth certificate as to whether the child was born in wedlock or out-of-wedlock. Prior to 1977, marital status was inferred by examining the statistical information on the certificate of live birth. In 1977, the procedure was modified to also identify out-of-wedlock live births for which paternity affidavits were filed. These births were previously inferred to have occurred in wedlock. This modification resulted in a noticeable increase in the estimated number of out-of-wedlock live births starting in 1977.

Deaths

The cause of death reported in this publication is the underlying cause classified according to the ninth revision of the *International Classification of Diseases* (ICD, 9th revision) adopted by New York State in 1979. Historically, several revisions of the ICD have been used; therefore, it is necessary to employ a comparability ratio when comparing cause of death statistics from one revision to another. Comparability ratios have been published by the National Center for Health Statistics (NCHS).

Infant and neonatal mortality rates published in this report are based on all live births regardless of birthweight or gestation. No attempt was made to account for the viability of the infant at birth. These rates for a specific year are based on live births that occurred during that year. While these live births are not the true population at risk, they are an accurate and timely estimate of that population.

Other institution is defined as state institution, Veterans Administration facility, hospice, federal institution, health related facility or home for the aged.

Spontaneous Fetal Deaths/Induced Abortions

Fetal deaths include both induced abortions and spontaneous fetal deaths and are presented separately in the report.

Fetal death is defined by New York State Public Health Law to be the death prior to the complete expulsion or extraction from its mother of a product of conception; the death is indicated by the fact that after such separation, the fetus does not breathe or show any other evidence of life such as beating of the heart, pulsation of the umbilical cord or definite movement of voluntary muscles.

In 1992, the New York City Department of Health implemented a program to improve reporting of spontaneous fetal deaths. As a result, during 1992 a substantial number of spontaneous fetal deaths recorded in New York City in the years 1991 and 1992 were reported. The data presented here reflect this increase in reporting of 1991 and 1992 events. All tables in this report containing information on 1991 spontaneous fetal deaths have been updated from previously published figures.

Operative procedure used for induced abortions is defined as dilation and curettage (D&C), suction and curettage, dilation & evacuation (D&E),saline injection, and other which includes prostaglandin injection, hysterectomy, hysterotomy and other procedures.

New York State Public Health Law requires the registration of all fetal deaths regardless of the gestation of the fetus. Unlike birth and death registration, the registration of fetal mortality is not uniform across the United States. In order to provide data comparable to other states, this report presents data for both spontaneous fetal deaths of gestation 20 weeks or more and for spontaneous fetal deaths of all gestations.

Population

Population Estimates - The July 1, 1992 estimates were calculated by adding the estimated natural increase during 1990-1992 and the estimated net-migration during 1990-1992 to the 1990 Census population. The estimated net-migration for each minor civil division in the state was based on the average annual net-migration experience during the 1986-1990 period.

The population for New York State exclusive of New York City is the sum of the estimates for the 57 counties in the state outside New York City. The population for New York City is the sum of the population estimates for the five counties of the city.

Population Estimates by Age and Sex - The population estimates by age and sex for July 1, 1992, appearing in Table 1 were estimated in two steps. The estimated number of children under five was developed from birth and death data and corrected for estimated net-migration. This migration was based on New York State birth and death data and the 1990 Modified Count data by age and sex. The population over five was estimated using the 1990 population by age and sex, resident death data by age and sex, and estimated migration data by age and sex based on the censuses of 1980 and 1990. The populations in each age group over five were then uniformly adjusted so that the sum of all the age groups in Table 1 equalled the population estimates for July 1, 1992, for New York City and New York State exclusive of New York City as given in Table 2.

The New York State population estimates by age and sex are the sum of the New York City and New York State exclusive of New York City estimates.

The standard five year age distribution for July 1, 1992 , as calculated above was subdivided into single year age groups by using the Sprague multipliers. The single year distributions were then combined to form population estimates for 15-17 and 18-19 age groups for New York City, New York State exclusive of New York City, and New York State.

Life Tables: A set of three life tables (Tables 3a, 3b, 3c) is presented which includes the total, male and female populations of New York State. Each life table consists of seven columns. They are:

Age -- the interval between two exact ages, x to x+n. For example, the age group *15-19* includes the five year interval of all persons aged 15 to 1 day less than 20 years old.

q -- is the probability of dying during x to x+n. This is the proportion of deaths that occur during the interval x to x+n among a cohort who were alive at the beginning of the interval.

l -- is the number of survivors at exact age x. Starting with a cohort of 100,000 live births, l is the number of persons who survived to the beginning of each age interval. The number of survivors at the beginning of an age interval multiplied by the probability of surviving the interval gives the number of survivors at the beginning of the next age interval.

d -- is the number of persons dying during x to x+n. This column represents the number of persons from the cohort of 100,000 who die during x to x+n.

L -- is the number of person-years lived during x to x+n. The number of person-years includes those who live the full n years of the interval and those who live less than n years.

T -- is the number of person-years lived beyond exact age x.

E -- is the expectation of life at exact age x. This is the average years of life remaining to be lived by persons of exact age x.

Vital Statistics Rates and Ratios

The definition of the rates used for this report are given below. In a definition, the numerator reflects the number of vital events counted in a specified period of time, usually a calendar year. The denominator refers to the population count at a specified point in time, usually mid-calendar year.

1. *Live Birth Rate*: Annual number of live births per 1,000 population.

2. *General Fertility Rate*: Annual number of live births per 1,000 female population aged 15-44.

3. *Teenage Live Birth Rate*: Annual number of live births to women aged 15-19 per 1,000 female population aged 15-19.

4. *Spontaneous Fetal Mortality Rate*: Annual number of spontaneous fetal deaths (all gestations) per 1,000 spontaneous fetal deaths (all gestations) plus live births occurring during the year.

5. *Abortion Ratio*: Annual number of induced abortions per 1,000 live births occurring during the year.

6. *Total Pregnancy Rate*: Annual number of pregnancies per 1,000 female population aged 15-44.

7. *Teenage Pregnancy Rate*: Annual number of teenage pregnancies per 1,000 female population aged 15-19.

8. *(Crude) Death Rate*: Annual number of deaths per 1,000 population.

9. *Infant Mortality Rate*: Annual number of deaths under one year of age per 1,000 live births occurring during the year.

10 *Neonatal Mortality Rate*: Annual number of deaths under 28 days of age per 1,000 live births occurring during the year.

11. *Postneonatal Mortality Rate*: Annual number of deaths at age 28 days and older but less than one year per 1,000 live births occurring during the year.

12. *Perinatal Mortality Rate*: Annual number of neonatal deaths plus spontaneous fetal deaths of gestation 20 weeks or more per 1,000 spontaneous fetal deaths of gestation 20 weeks or more plus live births occurring during the vear.

13. *Age-Specific Rate*: Annual number of deaths in a specified age group per 1,000 population in the same age group. Age is decendent's age at last birthday.

14. *Cause-Specific Death Rate*: Annual number of deaths from a specified cause or group of causes per 100,000 population. Exception: the death rate from complications of pregnancy, childbirth and the puerperium is defined as number of deaths from complications of pregnancy, childbirth and the puerperium occurring during the year per 100,000 live births occurring during that year. This death rate is called the maternal mortality rate. This cause of death category also includes any maternal death which may have resulted from an induced abortion.

15. *Age-Sex-Adjusted Death Rate (Direct Method)*: Death rate of a group calculated as a weighted average of the age-sex-specific death rate of the same group. The system of weights is the age-sex-distribution of a population called the standard population. In this report, the standard population is the census count of the New York State modified census population on April 1, 1990.

16. *Marriage Rate*: Annual number of marriages per 1,000 population.

17. *Dissolution of Marriage Rate*: Annual number of dissolutions of marriage per 1,000 population.

Small Area Data

In tabulating vital events for cities and villages with 15,000 or more population, the problem of small frequencies occurs. Statistics based on a small number of vital events are subject to a large degree of variability and inferences should be made with care.

Maps

The maps presented in this report show the rates associated with selected vital events. Population characteristics determine in part the size of these measurements. For each map the counties are ranked from the lowest to the highest rate. Counties are then classified into four categories: the lowest 10 percent of all counties, counties ranging from 10 to 50 percent, counties ranging from 50 to 90 percent and the highest 10 percent of all counties.

General mortality rates are influenced markedly by the age and sex distributions of the population. In general, men have higher death rates than women at all ages and people over the age of 55 die at a higher rate than the young.

In those counties different in rates but similar in population characteristics, identification of causative factors can be obtained only by rigorous epidemiological studies, not by simple correlations of vital statistics.
